

Day 1 - Enterprise-Grade Solution Design (SDD)

Session Overview

60 Min

Total Time Allotted

Primary Objective:

Translate the HR BRD into a comprehensive, production-ready Solution Design Diagram (SDD).

Key Design Considerations

- Agentic Architecture
- Choice of Runtime
- Choice of conversational UI
- System Design on GCP
- AI Safety & Governance

Participant Action Items

- Understand requirements in BRD ([go/elevate-apac-m3-brd](https://go.elevate-apac-m3-brd)).
- Duplicate [go/elevate-apac-m3-sdd](https://go.elevate-apac-m3-sdd)
- Design away!

Day 2 - Assessment & Peer Defense

Session Overview

50 Min

Total Time Allotted

Core Method:

Evaluate your own Solution Design Diagram (SDD) and cross-examine with a peer team to pressure-test your architecture.

Agenda & Activities

Self-Assessment (20m)

Use the provided AGY skills to auto-evaluate your SDD. Upload the results to the Artefact Submission Server.

Peer Defense (30m)

Pair with another team. Present your architecture, critique their choices, and defend your technical decisions.

Participant Action Items

Run local AGY skill checks against the spec.md. Actively critique the paired team's architecture. Iterate your own design based on feedback.

Day 3 - Local Build & Enterprise Integrations

Session Overview

60 Min

Total Time (3x 20 min sprints)

Trainer Support Model:

Verbal Guidance → Documentation → Scaffolding →
Reference Code (Emergency)

Build & Integration Tasks

SaaS Integration

Obtain MCP credentials from go/elevate-saas. Integrate WorkWeek (HCM) and ServiceNow (ITSM) tools.

RAG Build

Initialize FAISS or Agent Search. Ingest the static HR policy documents.

A2A Orchestration

Build orchestrator logic routing between SaaS tools and the RAG knowledge base.

Participant Action Items

Split the workload: Dev 1 handles WorkWeek MCP, Dev 2 handles ServiceNow MCP, Dev 3 handles RAG/Orchestration.

Day 3 - Generating Multi-Agent Evaluations

Session Overview

60 Min

Total Time (3x 20 min sprints)

Core Deliverable:

eval.json artifact representing automated evaluation results.

Evaluation Dimensions

Performance Evaluation

Does it answer policy questions correctly based only on the provided PDFs?

Guardrail Evaluation

Does it block jailbreaks? Does it prevent unauthorized PTO requests?

Trajectory Evaluation

Does it complete multi-step chains (e.g., Query Policy → Check Balance → Open Ticket)?

Participant Action Items

Write automated tests using the ADK. Compile and format the resulting eval.json for submission tomorrow.

Day 4 (AM) - Deployment & Infrastructure

- **Time Allotted:** 60 Minutes
- **Datastore Setup:** Provision Agent Search (Vertex AI Search) natively on GCP.
- **Identity Management:** Establish service accounts, Secret Manager for MCP tokens, and strict IAM.
- **Memory & State:** Configure the Memory Bank and GEAP Session Management.
- **Deployment:** Deploy the code to the Agent Engine.
- **Stretch Goal:** Use Terraform for IaC and Cloud Build for automated GitOps.

Participant Action Items

Submit Codebase Readiness Assessment and eval.json to the Submission Server. Migrate local configurations to GCP native services.

Day 4 (AM) - Security, Governance & Model Armor

Session Overview

60 Min

Total Time Allotted

Key Focus:

Establishing security boundaries, agent routing, and data protection policies.

Security & Governance

Agent Registry

Catalog all deployed agents for centralized governance.

Agent Gateway

Bind your agents behind the gateway to manage traffic and policies.

Model Armor

Configure input/output scanning to prevent data exfiltration and toxicity.

Participant Action Items

Turn on Cloud Audit Logs. Configure and verify Model Armor intercept rules.
